

IN THE CLAIMS

Please amend the claims as follows.

1-15. Canceled

16. (Previously Presented) A method comprising:

processing a plurality of frames to provide a stream of packets that includes the plurality of frames and a set of localizing data that facilitates distinguishing locations of frame header information and frame data of each frame within the stream of packets, and

including one or more of the set of localizing data in one or more packets of the stream of packets.

17. (Previously Presented) The method of claim 16, including

distinguishing the location of frame data in each frame, based on the localizing data, encrypting the frame data of each frame to provide encrypted frame data, and

providing the encrypted frame data as the frame data of each frame within the stream, and providing a second stream of data that includes the frame header information and the

encrypted frame data of each frame and localizing data that facilitates distinguishing locations of the frame header information and the encrypted frame data within the stream.

18. (Previously Presented) The method of claim 16, wherein

the localizing data facilitates distinguishing encrypted and non-encrypted content of the stream of packets.

19. (Previously Presented) The method of claim 16, wherein

the one or more of the localizing data is included in header information of the one or more packets.

20. (Previously Presented) The method of claim 16, wherein

the stream of packets corresponds to a stream of RTP-packets.

21. (Previously Presented) The method of claim 16, wherein

each packet of the stream of packets includes at least one of: a partial frame, and one or more full frames.

22. (Previously Presented) The method of claim 16, wherein

the one or more of the localizing data is included in hint tracks of the stream of packets.

23. (Previously Presented) The method of claim 16, including

transmitting the stream of packets to a remote system.

24. (Previously Presented) A system comprising:

a first buffer that is configured to receive a plurality of frames,

a processor that is configured to process the plurality of frames to:

create a stream of packets that includes the plurality of frames and a set of localizing data that facilitates distinguishing locations of frame header information and frame data of each frame within the stream, and

include one or more of the set of localizing data in one or more packets of the stream of packets.

25. (Previously Presented) The system of claim 24, including

an encryption module that is configured to:

distinguishing the location of frame data in each frame, based on the localizing data,

encrypt the frame data of each frame to provide encrypted frame data, and

provide a second stream of packets that includes the frame header information and the encrypted frame data of each frame and localizing data that facilitates distinguishing locations of the frame header information and the encrypted frame data within the stream.

26. (Previously Presented) The system of claim 25, wherein
the encryption module is configured to transmit the second stream of packets to a remote system.
27. (Previously Presented) The system of claim 24, wherein
the localizing data facilitates distinguishing encrypted and non-encrypted content of the stream of packets.
28. (Previously Presented) The system of claim 24, wherein
the one or more of the localizing data is included in header information of the one or more packets.
29. (Previously Presented) The system of claim 24, wherein
the stream of packets corresponds to a stream of RTP-packets.
30. (Previously Presented) The system of claim 24, wherein
each packet of the stream of packets includes at least one of: a partial frame, and one or more full frames.
31. (Previously Presented) The system of claim 24, wherein
the one or more of the localizing data is included in hint tracks of the stream of packets.
32. (Previously Presented) The system of claim 24, including
a transmitting module that is configured to transmit the stream of packets to a remote system.
33. (Previously Presented) A system including
a receiver that is configured to receive a stream of packets, and

a processor that is configured to process the stream of packets to distinguish frame header information and frame data of a plurality of frames within the stream of packets, based on localizing data that is included within the stream of packets.

34. (Previously Presented) The system of claim 33, including

a decryptor that is configured to:

extract the frame data from the stream of packets, based on the localizing data, and

decrypt the frame data to provide decrypted frame data.

35. (Previously Presented) The system of claim 34, including

a processor that is configured to process the frame header information and decrypted frame data to provide content information to a user application.
